

## ACKNOWLEDGEMENTS

This project could not have been completed without the assistance and cooperation of a number of people. Wade Bryant was involved in all aspects of the study, from field reconnaissance to data analysis. His enthusiasm for exploring new wetland sites contributed to the success of the first phase of the project. Roxana Capps provided expert data analysis for a large part of the vegetation analysis and shoreline survey. Although her presence was relatively brief, it came at a crucial period of the project. Hank McKellar is to be thanked for recommending her.

Charles Daniel, III of the U.S. Geological Survey in Raleigh kindly made available data on the hydrologic characteristics of the Rayes Beach site. The hydrologic phase of this report would have been absent had he not exhumed numbers that had been buried for a decade. Kevin Moorhead, Division of Soil and Water Conservation, NRCD, promptly filled requests for NWI maps. Kevin Moorhead and John Hefner of the Fish and Wildlife Service provided advice on aggregating NWI wetland types and made available early drafts of NWI maps when they became available. Bob Noffsinger of the U.S. Fish and Wildlife Service at the Alligator River National Wildlife Refuge provided expert guidance in the field during the reconnaissance phase of the project. Union Camp Corporation in Franklin, Virginia granted permission to use the site at Rayes Beach and provided access to the study area.

Peter Parham and Mark Purser, graduate students in the Geology Department, conducted the sediment surveys and assisted in the field with the vegetation analysis and leveling. Much of the map analysis was done by them as well as James McDonald and Laura Stasavich. Todd Ball explored early approaches to extracting data from NWI maps. Jim Watson of the Geology Department at ECU kindly loaned aerial photographs of the Albemarle Sound regions.
